Logan was a commercial artist and writer with a strong firearms interest. This book contains excellent drawings, labels, and identification for cartridge types illustrating development from paper cartridge to the modern types. Patient delving into this volume will show an alert reader how paper cartridges became metal cartridges. Most general readers have no conception, for example, how many competing systems were in place during the Civil War. By 1873 all had become obsolete but the two still in use today--rimfire and center fire. Logan divides cartridge types into groups: paper, combustible, separate primed, self-contained, rimfire, and center fire. Each of these divisions break down into variations. All systematic discussions must use or grapple with these divisions. The most common Civil War cartridge was a paper wrapper which held black powder and a bullet. The cartridge had to be torn or bitten open, the powder poured down the barrel, followed by the bullet and rammed until compact. A percussion cap was added to the weapon to ignite the powder. A quantum leap forward was a metal cartridge with a hole in the base. It was loaded into the weapon and the percussion cap was added outside. Finally a complete cartridge was developed which could be placed inside the weapon and fired when the chamber was closed. The author shows what the competing systems were and how they worked. His book is a good introduction. Any serious collector or student of cartridge history will need more references, but Logan's Cartridges can be the beginning place for the study. There are a few errors and, obviously, omissions but the work is excellent for its vintage. Few fifty year old books on technology can claim that.--By Antonius Tio.--For Amazon.com. This three-volume handbook is the standard reference in the field, unparalleled in its comprehensiveness. It covers every conceivable topic related to the expanding and increasingly important field of ion chromatography. The fourth edition is completely updated and revised to include the latest developments in the instrumentation, now stretching to

three volumes to reflect the current state of applications. Ion chromatography is one of the most widely used separation techniques of analytical chemistry with applications in fields such as medicinal chemistry, water chemistry and materials science. Consequently, the number of users of this method is continuously growing, underlining the need for an up-to-date reference. A true pioneer of this method, Joachim Weiss studied chemistry at the Technical University of Berlin (Germany), where he also received his PhD degree in Analytical Chemistry. In 2002, he did his habilitation in Analytical Chemistry at the Leopold-Franzens University in Innsbruck (Austria), where he is also teaching liquid chromatography. Since 1982, Dr. Weiss has worked at Dionex (now being part of Thermo Fisher Scientific), where he currently holds the position of Technical Director for Dionex Products within the Chromatography and Mass Spectrometry Division (CMD) of Thermo Fisher Scientific, located in Dreieich (Germany).

Budget report for 1929/31 deals also with the operations of the fiscal year ended June 30, 1928 and the estimates for the fiscal year ending June 30, 1929. At a time when crime scene television shows are all the rage amongst the civilian population, knowledge of firearm forensics is of paramount importance to crime scene analysts, police detectives, and attorneys for both the prosecution and the defense. Bailey) With "Lookout Cartridge," Joseph McElroy established a reputation as one of contemporary fiction's foremost innovators and deft observers into the fissures of modern society. It is a novel of dazzling intricacy, absorbing suspense, and the highest ambition: to redeem the great claim of paranoia on the American psyche. In trying to figure out just who is so threatened by an innocent piece of cinema verité? filmed in collaboration with a friend, Cartwright finds himself at the heart of a mystery stretching from New York and London to Corsica and Stonehenge. With each new fact he gathers, both the intricacy of the syndicate arrayed against him and what his search will cost him become alarmingly clear. Now available for the first time since 2003, The Handloader's Manual of Cartridge Conversions offers the handloader all the physical data, how-to designs, tools, and drawings needed to convert modern, easily obtainable materials into more than 1,000 different rifle and pistol cartridge cases, ranging from the obsolete patterns to modern, cutting-edge "wildcats." This classic guide has been revised with a new, easy-to-reference format, complete with a full index of hundreds of cartridges. This truly is the handloader's one-stop guide for creating personalized cartridges. Ground-based heat treatment tests are planned on an argon gas-filled tantalum cartridge developed as part of a Diffusion Processes in Molten Semiconductors (DPIMS) experiment conducted on NASA's Space Shuttle. The possibility that the cartridge may creep during testing and touch the furnace walls is of real concern in this program. The present paper discusses the results of calculations performed to evaluate this possibility. Deformation mechanism maps were constructed using literature data in order to identify the creep mechanism dominant under the appropriate stresses and temperatures corresponding to the test conditions. These results showed that power-law creep was dominant when the grain size of the material exceeded 55  $\mu\text{m}$  but Coble creep was the important mechanism below this value of grain size. Finite element analysis was used to analyze the heat treatment treatments assuming a furnace run away condition (which is a worst case scenario) using the appropriate creep parameters corresponding to grain sizes of 1 and 100  $\mu\text{m}$ . Calculations were also conducted to simulate the effect of an initial 3° tilt of the cartridge assembly, the maximum possible tilt angle. The von Mises stress and strain distributions were calculated assuming that the cartridge was fixed at one end as it was heated from ambient temperature to 1823 K in 1.42 h, maintained at 1823 K for 9.5 h and then further heated to an over temperature condition of 2028 K in 0.3 h. The inelastic axial and radial displacements of the cartridge walls were evaluated by resolving the von Mises strain along the corresponding directions. These calculations reveal that the maximum axial and radial displacements are expected to be about 2.9 and 0.25 mm, respectively, for both fine and coarse-grained materials at 2028 K. It was determined that these displacements occur during heat-

up to temperature and creep of the cartridge is likely to be relatively insignificant irrespective of grain size. Furthermore, with a 3' tilt of th...
