The measurement of patient satisfaction is a time-honored field of inquiry in health care. Physical therapists are only beginning to study patient satisfaction concepts. It is incumbent on physical therapists to seek accurate input from patients to maintain and gain credibility in a competitive market. Development and refinement of theory and measurement methodology is needed. This study furthers the research of Roush and Sonstroem in patient satisfaction. In the original study, the researchers developed questionnaire items to measure four dimensions of care. These items were tested over three phases for internal reliability and concurrent and construct validity, with good results. Although the Roush and Sonstroem (1999) study was methodologically sound, providing rigorous treatment of measurement issues, it presented some limitations. The study was done in southern New England with a convenience sample of clients actively participating in treatment. Generalization to a different geographic area is limited. In addition, non-participants who might be dissatisfied with services were not included. This project endeavors to re-test the Physical Therapy Outpatient Satisfaction Survey (Roush and Sonstroem, 1999) with physical therapy clinics in the Gulf South United States of America. Internal reliability, construct and predictive validity are investigated. Sociodemographic and treatment factors are examined to develop a model of patient satisfaction in physical therapy. Using cluster sampling, twenty outpatient clinics were recruited from a weighted, randomized list of clinics participating in internship programs at University of Mississippi Medical Center physical therapist educational program. Up to 125 randomly selected patients from each clinic who were 21 years of age or older who had been discharged or become inactive within the past ninety days were mailed the Physical Therapy Outpatient Satisfaction Survey. Principal components analysis was used to explore the dimensions of satisfaction. The dimensions remained remarkably consistent with this sample and methodology. Cronbach alpha scores indicated a high level of internal consistency. Finally, the factors from the survey items, together with demographic and clinical variables were incorporated into a regression analysis, which supported the four factor scores, and the patient's rating of improvement predictive of satisfaction. For those involved with students with disabilities, this book helps them make sound decisions about services that will make a meaningful difference in the lives of these children. Since the 1975 enactment of Public Law 94-142, which mandated that occupational and physical therapy be provided "as may be required by a handicapped child to benefit from special education," this required link between therapy and education has continued to lead to confusion and controversy about which students should receive therapy in school and what types of services should be provided. The purpose of *Occupational and Physical Therapy in Educational Environments* is to clarify the major issues surrounding occupational and physical therapy in public schools, and to provide a framework for delivery of team- and family-oriented services that meet individual needs of students with disabilities. For those unsure of current regulations regarding handicapped students, or those who need clarification on the law, the book begins with a review of legislation and regulations. This begins to guide and shape schools' provision of therapy services. The following chapters assist occupational and physical therapists and important members of the educational teams of disabled students to make sound decisions about which students need school-based therapy services: *Laws that Shape Therapy Services in Educational Environments*: summarizes the major statutory law, federal regulations, and case law interpretation in which school-based practice is grounded. *Pediatric Therapy in the 1990s*: reviews contemporary theories of motor development, motor control, and motor learning that have had major impact on therapy for school-age children with disabilities. *Related Services Decision-Making*: describes a strong team approach to determining a student's need for occupational and physical therapy services, which takes into account the unique characteristics of both the student and the educational team.

Assessment and Intervention in School-Based Practice: describes an approach to assessment and intervention in schools that clearly illustrates a relationship between therapy and educational programs that result in meaningful outcomes for students. Challenges of Interagency Collaboration: reports on a qualitative study that points out that schools are not the only settings in which many students with disabilities receive services, so coordination between various agencies is essential to avoid gaps, overlaps, and cross purposes. Those who can benefit from Occupational and Physical Therapy in Educational Environments include occupational and physical therapists who work in public schools, school administrators, teachers, and even parents of disabled children. Abstract: BACKGROUND: The expanding geriatric population presents with many chronic illnesses and resultant functional limitations. These problems create a greater need for long-term care services. Inadequate staffing and resources can cause a decline in the quality of nursing home care. The researchers examined the organization of physical therapy services provided in U.S. nursing homes. METHODS: The researchers utilized data from the 1997 NNHS in order to conduct this study. The sampling methodology was a non-probability, cross-sectional, and retrospective research design. Weights provided by the NCHS were used to generate national estimates. Descriptive statistics were generated and chi-square analysis was performed on variables of interest. RESULTS: 97% of U.S. nursing homes were found to offer physical therapy services. Of these facilities, 46% employed their own FTE PTs, 61% were located in an MSA, 67% were for-profit, 57% were members of a group or chain, 43% had 100-199 beds,

16% provided an area for rehabilitation care, and 13% provided an area for sub-acute care. **DISCUSSION:** Data regarding MSA status, ownership, services provided, staffing of FTE PTs, and bed size are beneficial to physical therapists seeking potential employment opportunities and also to consumers when faced with the choice of a nursing home. **CONCLUSION:** Nursing homes in an MSA, that are for-profit, members of a chain or group, and have 100-199 beds will most likely provide the greatest quantity of physical therapy services and, therefore, may provide the best care to their residents. Expert author Ken Olson is a highly respected authority on the subject of spinal manipulation in physical therapy. A clear, consistent format for explaining techniques makes this reference easy to use in the clinical setting. NEW! Coverage of emerging topics includes soft tissue assessment, mobilization, dry needling, myofascial pain and trigger points, thoracic outlet syndrome, cervicogenic dizziness, and differentiation of headache types, plus expanded coverage of examination procedures and psychologically informed management strategies for chronic low back pain. NEW! Full-color design and photographs show essential concepts and procedures from multiple angles, illustrating hand and body placement and direction of force. UPDATED evidence-based research provides the latest thinking on manual therapy of the spine. Stressing solutions rather than pathology, clients' strengths and their strategies for past successes rather than their weaknesses or problems, this team utilizes a solution-building approach by discovering and exploring the ways substance abusers heal themselves. The book covers solution-focused therapy one step at a time. Bursting with case examples, quick tips, and questions "from the field," this is a reader-friendly manual. The *Clinical Practice of Pediatric Physical Therapy* provides students and clinicians with an intervention-focused approach to pediatric physical therapy. Beginning with an overview of developmental theories and the foundations of assessment, examination, and evaluation, this text will discuss various conditions and their manifestations in the pediatric population, along with interventions tailored to the population. The text then concludes with legal issues impacting pediatric physical therapy practice and an examination of the "transition" to adult services.
